Cosgrove D;

```
The present invention describes a method for treating a patient having a chronic inflammatory disease. The method comprises administering to the patient a blocking agent (I) to neutralise the capacity of Collagen XIII to bind to an alphalbetal integrin. Also described: (I) treating a subject having an inflammatory disease or other conditions where integrin alphalbetal-positive interstitial monocyte and/or lymphocyte accumulation is observed; (2) reducing selective efflux of integrin alphalbetal-continue monocytes into the interstitium of chronically inflamed tissues; (3) reducing the rate of monocyte and/or lymphocyte efflux into the interstitial pace of chronically inflamed tissues; (4) blocking the interaction of alphalbetal integrin on peripheral blood monocytes and/or lymphocytes with Collagen XIII vascular endothelium of chronically or inflamed tissues; (5) identifying an agent that inhibits the efflux of monocytes and/or lymphocytes are implicated; (6) an isolated peptide (6) an isolated peptide (7) having the sequence Gly-Ala-Glu-Gly-Ser-Pro-Gly-Leu (SEQ ID NO:1, ADO15278) and that disrupts the interaction between Collagen XIII and alphalbetal integrin; and (7) an antibody to the peptide. (I) has antiinflammatory antipsoriatic and antiarthritic activities, and can be chronic inflammatory disease, e.g., renal fibrosis, lung fibrosis, liver collagens, rheumatoid arthritis, psoriasis, experimental colitis or liver contic glomerulonephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chronic inflammatory disease; blocking agent; collagen XIII; collagen XIII and alphalbetal integrin binding inhibitor; collagen XIII; alphalbetal integrin; inflammatory disease; antiinflammatory; antipsoriatic; antiarthritic; gene therapy; renal fibrosis; luver fibrosis; rheumatoid arthritis; psoriasis; experimental colitis; crescentic glomerulonephritis.

The present invention describes a method for treating a patient having a chronic inflammatory disease. The method comprises administering to the chronic inflammatory disease. The method comprises administering to the patient a blocking agent (1) to neutralise the capacity of Collagen XIII collade to an alphalbetal integrin. Also described: (1) treating a subject having an inflammatory disease or other conditions where integrin alphalbetal-positive interstitial monocyte and/or lymphocyte accumulation is observed; (2) reducing selective efflux of integrin alphalbetal-correction of alphalbetal interstitial monocyte efflux into the interstitial space of chronically inflamed tissues; (3) reducing the rate of monocyte and/or lymphocyte efflux into the interstitial space of chronically inflamed tissues; (5) identifying an agent that inhibits the efflux of inflamed tissues; (5) identifying an agent that inhibits the efflux of monocytes into the interstitial space of a model where interstitial compocytes and/or lymphocytes are implicated; (6) an isolated peptide compocytes and that disrupts the interaction between Collagen XIII and alphalbetal integrin; and (7) an antibody to the peptide. (1) has antihilammatory and seaso of a model where interstitian constitution inflammatory disease, e.g., renal fibrosis, lung fibrosis, liver correction integrin integrin binding inhibiting peptide, which is given the processor of the processor is a collagen constitution of the interstities. The present sequence represents a collagen constitution of the processor integrine of the processor integrine of the processor is a collagen constitution of the processor integrine integrine binding inhibiting peptide, which is given in the processor in the processor in the processor is a collagen in the processor is the present integrine of the processor is a collagen of the processor is a colla
                                                                                                     Treating a patient having a chronic inflammatory disease e.g., liver fibrosis, rheumatoid arthritis or psoriasis by administering a blocking agent to neutralize the capacity of Collagen XIII to bind to an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. call proliferative disorders, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline connection. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this parent is not represented in the printed specification, but was obtained in electronic format directly

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A delative form one of the 2722 sequences defined in the specification. A diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, neurological disorders, destrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals committee biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the cinvention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

The invention relates to novel diagnostic and therapeutic polynuclectides selected from one of the 272 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human collection and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost and therapeutic polynucleotides (dithp) or polypeptides may be used to disperse e.g. cell proliferative disorder associated with human molecules, e.g. cell proliferative disorder, autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, developmental disorders, or infections caused by virus, bacteria, fungion parabite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the print of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to novel diagnostic and therapeutic polynucleotides calected from one of the 2722 sequences defined in the specification. A calected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human caled to diagnost a particular condition, disease or disorder associated used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine caused uncolmanacinital disorders, or disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conditions also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline colymorphisms, as molecular weight markers, and for somatic or germline colymorphisms, as sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                              ä
                                                                                                                                                                                          New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A proposed from one of the 2722 sequences defined in the specification. A proposed of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, neurological disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, hactering single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorders, dastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp confections and sae bueed in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                                      The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A construction and therapeutic polymucleotides (dithp) or polymetherapeutic polymucleotides (dithp) or polymetherapeutic polymucleotides (dithp) or polymetherapeutic polymucleotides (dithp) or polymetherapeutic constituents associated used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp of indecidents as also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A selected from one of the 2722 sequences defined in the specification. A colynucleotide invention may have a use in gene therapy. The human care diagnostic and therapeutic polynucleotides (lithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp collection may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gietzen D;

                                                                                                                                                                                                                                                                                  The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A purelectide of the invention may have a use in gene therappy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or autoimmune/inflammatory disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp conflections and also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the gene therapy. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F; Harthshorne TA, Suchorolski MT, Altus CM, Pitts SJ, Elder LV; Mooney EM, Delegeane AM, Panesar IS, Banville SC, Reddy TP. The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concluses may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                           The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A selected from one of the 2722 sequences defined in the specification. A polynucleotides of the invention may have a use in gene therapy. The human classons of the invention may have a use in gene therapy. The human classons a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine of autoimmus/inflammatory disorder, developmental disorder, endocrine clasorder, neurological disorders, dastrointestinal disorders, or infections caused by virus, bacteria, fungi or paramite. The dithprocrime may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gietzen D;
                        New diagnostic and therapeutic polynuclectides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A splantaleotide of the invention may have a use in gene therapy. The human coloride intention in the specification. A diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, gastrointestinal disorders, or disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or paralte. The dithp molecules may also be used in generic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but, was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Wright RJ, Bruns CM, Marjanovic MM, Shen F;

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A polymucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine cautoimmune/inflammatory disorder, developmental disorders, or autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp conflowment and also present sequence represents a dithp protein of gene polymorphisms, as molecular weight markers, and for somatic or germline capen therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F; Harthshorne TA, Suchorolski MT, Altus CM, Pitts SJ, Elder LV; Mooney EM, Delegeane AM, Panesar IS, Banville SC, Reddy TP. The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concletus may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

(INCY-) INCYTE GENOMICS INC.

```
The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human changestic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimune/finflammanchy disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp procein of the cinnention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   anticonvulsant; nootropic; neuroprotective; immunosuppressive; dermatological; anti-inflammatory; cytostatic; antiarteriosclerotic; gene therapy; call adhesion; extracellular matrix; CADECM; immune system disorder; AIDS; allergy; neurological disorder; stroke; Parkinson's disease; epilepsy; developmental disorder; Down's syndrome; cerebral palsy; connective tissue disorder; systemic lupus erythematosus; genetic disorder; Alport's syndrome; cell proliferative disorder; cancer;
in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.

                                                                                                                                                                                                                                                                                              The present invention relates to novel human cell adhesion and extracellular matrix proteins, CADECM-11 to CADECM-22, and their coding sequences (ACC00392-ACC00413 and ABR40104-ABR40125). The coding sequences and proteins are useful in diagnosling, treating and preventing disorders associated with aberrant expression of CADECM, such as immune system disorders (e.g. AIDS or allergies), neurological disorders (e.g. stroke, Parkinson's disease or epilepsy), developmental disorders (e.g. bown's syndrome or cerebral palsy), connective tissue disorders (e.g. systemic lupus erythematosus), genetic disorders (e.g. syndrome) or cell proliferative disorders (e.g. cancer or atherosclerosis)
                                                                                                                                                                    New human cell adhesion and extracellular matrix proteins (CADECM), useful for diagnosing, treating or preventing disorders associated with aberrant CADECM expression, e.g. cancer, AIDS, atherosclerosis, allergies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gietzen D;

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A purity control of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine utoimmune/inflammatory disorder, developmental disorders, or autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, bacteria, fungi or parasite or genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline continue biological samples, in detecting single nucleotide content in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                         New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) comprises contacting endothelial cells with a composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation of correlates with lymphoedema in human subjects, and with the proviso that the LEC protein is not VEGFR-3; and administering to the subject a composition comprising a lymphatic growth agent selected from VEGFC or VEGF-D polypeptides and polynucleotides. The invention may be useful for the development of compounds with an antiangiogenic, cytostatic, the development of compounds with an antiangiogenic, cytostatic, correct antimifialmmatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphatic endothelial cells in treating hereditary lymphoedema, in screening for an endothelial cells disorder or correct of a drug on endothelial cells. The agent is useful in manufacturing a medicament for the disorder or in monitoring the efficacy or toxicity of a drug on endothelial cells. The agent is useful in manufacturing a cell or lymphatic vessels endothelial cell growth or differentiation in a companies of other diseases involving the lymphatic vessels, such as the content in the present sequence is that of a human LEC/BEC differentially content and concer metastasis via the lymphatic content and any also be used in metastasis via the lymphatic content and any also be used in metastasis via the lymphatic content sequence is that of a human LEC/BEC differentially content and the lymphatic content and content and content and content and content and content and content an

polymer, cationic liquid, polyamine type reagent, polyamine type reagent or calcium phosphate. This sequence represents the murine collagen alpha-2(IV) chain which is used in the composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a recombinant DNA in which DNA encoding a collagen-like protein is linked to the 3' terminal of a DNA containing a promoter region derived from Bacillus brevis. The bacterium is cultured, and used for the useful for the large scale production of a stable soluble collagen-like protein in the medium. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New collagen-like protein - useful for large scale production of stable collagen-like protein.
                                                                                                                              Length 738;

                                                                                                                                                                                                                       ઠે
                                                                                  The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a corpuply axis and treatment of pathological conditions resulting from a corpuply axis and treatment of pathological conditions resulting from a corpus antiboterial infection, for evaluating a compound, such as a polymeptide, of for the ability to bind a P. aeruginosa nucleic acid, as components of including anti-P. aeruginosa drugs, as templates for recombinant components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences Associated as the sequence and for this patent did not form part of the invention. Note: The specification but was obtained in electronic format from USPFO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel composition for improving transduction efficiency of a nucleic acid into a cell from nervous tissue which comprises a cell adhesion molecule and a gene-transfer reagent. The invention also describes a device, kit and novel method for improving nucleic acid transduction efficiency of a cell on a solid phase. The cell adhesion molecule contains an extracellular matrix chosen from collagen, laminin and fibronectin. The gene transfer reagent comprises a cationic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition useful for improving transduction efficiency of nucleic ac
into cell, comprises cell adhesion molecule and gene-transfer reagent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell transduction; nerves; cell adhesion; collagen alpha-2(IV) chain.

This invention describes novel polynuclectides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynuclectides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; gene therapy; vaccine; disease treatment; detection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes a recombinant DNA in which DNA encoding a collagen-like protein is linked to the 3' terminal of a DNA containing a grondcer region derived from Bacillus brevis. The bacterium is cultured, and used for the useful for the large scale production of a stable soluble collagen-like protein in the medium. The present sequence represents a collagen-like protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                New collagen-like protein - useful for large scale production of stable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids having the sequences of clones isolated from libraries of different human tissues, useful in recombinant DNA methodologies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention
     οŧ
Nucleic acids having the sequences of clones isolated from libraries different human tissues, useful in recombinant DNA methodologies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     90.5%; Score 38; DB 4; Length 136;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the C-terminal 219 amino acids of the human alphal collagen protein. Peptides derived from the protien were used to demonstrate incorporation of 3,4-dehydro-L-proline into the peptide, using the method of the invention. The specification describes a method for the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting at least one 3,4-dehydroproline residue in the polypeptide with an epoxidation reagent from a polypeptide containing at least one 3,4-geoxyproline residue. The method is used for studying the effects of non-natural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bloadhesives), and for incorporating a wide variety of groups, including therapeutic ligands and biological probes, into polypeptides
                                                                                                                                                                                                                                                                                                                                                                        Incorporating non-natural amino acid into polypeptide, useful production of bioadhesives, by epoxidation or substitution of dehydroproline residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A C-terminal fragment of human collagen type 1 (alpha2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          90.5%; Scor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The specification describes a recombinant DNA in which DNA encoding a collagen-like protein is linked to the 3' terminal of a DNA containing a promoter region derived from Bacillus brevis. The bacterium is cultured, and used for the useful for the large scale production of a stable soluble collagen-like protein in the medium. The present sequence represents a collagen-like protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New collagen-like protein - useful for large scale production of stable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Alphal collagen; 3,4-dehydro-L-proline; epoxidation; 3,4-epoxyproline; collagen; mussel adhesive protein; bioadhesive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              THE STATE OF THE S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                             matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises not ordinarily sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Extracellular matrix protein, self aggregation, hydroxylated proline, trans-4-hydroxyproline, 3-hydroxyproline, recombinant protein production, collagen, fibrinogen, fibronectin, post translational hydroxylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. The present sequence represents a C-terminal fragment of human collagen type 1 (alpha2), with optimised codon usage, designated D4
                                                                                                                                    Production of extracellular matrix proteins containing 4-trans-
hydroxyproline results in native self aggregating proteins, useful on
medical implants.

matrix protein or the fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the coll with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-cid, yardxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the hydroxyproline into proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional corporation of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. The present sequence represents a C-terminal fragment of human collagen type ( | Alphal), with optimised codon usage, designated D4
                          nydroxyproline results in native self aggregating proteins, useful on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacterial infection, Pseudomonas aeruginosa infection, antibacterial.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                               polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial dargets, as templates for antibacterial darges, including anti-P. aeruginosa derived peptides for antibacterial darges, production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 respresent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the princed specification but was obtained in electronic format from USPTO at

cc ; or (iii) a nucleic acid sequence of SEQ ID NOS: 471-697. Also described are: (1) a DNA construct comprising at least one polynucleotide having ct he sequence of SEQ ID NOS: 1-237 or thair conservative variants; (2) a plant cell transformed with the DNA construct of (1); (3) a transgenic comprising the plant cell of (2); (4) a method of making a transgenic transformed plant; (5) a wood or a wood pulp obtained from a transgenic cree which has been transformed with the DNA construct of (1); (6) a comprising an amino acid sequence encoded by the new isolated comprising an amino acid sequence encoded by the new isolated of polynucleotide or comprising any of the amino acid sequences of SEQ ID NOS: 261-497; (8) a method of altering a plant phenotype of a plant; (9) a method of correlating gene expression in two different samples; (10) a correlating gene expression in two different samples; (10) a correlating gene expression in the plant of one or more genes; (11) a method of correlating expression of a plant phenotype to the level of correlating gene expression to a stage of the cell cycle; (12) a conditionation, for detecting expression of one or more genes, comprising to a nucleic acid sequence of SEQ ID NOS: 1-237; (13) a comprising the combination of one or more genes, comprising to a nucleic acid sequence of SEQ ID NOS: 1-237; (13) a correlating the solid support, where each of the two or more oligonucleotides a unique consist and a sample. (11) a method for detecting one or more oligonucleotides a unique consist and a sample. (12) a method for detecting one or more oligonucleotides one or more oligonucleotid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             genes in a sample; (15) a method for detecting one or more nucleic acid sequences encoded by one or more genes in a sample; and (16) a kit, for detecting gene expression, comprising the microarray of (13) together with one or more buffers or reagens for a nucleotide hybridization reaction. The polynucleotides, polypeptides, DNA construct, composition, phenotype. This is the amino acid sequence of a cell cycle protein isolated in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neoplastic pancreatic cell; pancreatic cell; pancreatic cancer; cancer death; cytostatic; vaccine; gene therapy; non-cancerous pancreas disease; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                    ö
                                                                      This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
              staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.
 pancreatic specific nucleic acid molecule or protein for diagnosing,
                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises the amino acid sequences of 13 human gelatin proteins which are useful in the manufacture of gelatin capsules, encapsulants, or films. The present amino acid sequence represents a human gelatin protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, inaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is
                                                                                                                                                                                                                                                                                   New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid sequences of 13 human gelatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 90.5%; Score 38; DB 7; Length 516; Best Local Similarity 100.0%; Pred. This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to cDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antisense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, short memory and various cancers, disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintaining equilibrium of sense or motor function, and to treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, noctropic, antiparkinsonian, cytostatic and tranquiliser activities. This polypeptide is a protein canceded by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

```
This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                   New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.

                                                                                                                                                                                                                                                 ద
                                                                                                                                                                                                                ð
                                                                                                                                                                                                                            The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO8436 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at

                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises the amino acid sequences of 13 human gelatin protetins which are useful in the manufacture of gelatin capsules, encapsulants, or films. The present amino acid sequence represents a human gelatin protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises the amino acid sequences of 13 human gelatin proteins which are useful in the manufacture of gelatin capsules, encapsulants, or films. The present amino acid sequence represents a human gelatin protein of the invention.

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily dydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; in corporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins whose ability to self aggregate and produce functional fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Alphal collagen; 3,4-dehydro-L-proline; epoxidation; 3,4-epoxyproline; collagen; mussel adhesive protein; bioadhesive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Incorporating non-natural amino acid into polypeptide, useful e.g. for
              Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins, useful on medical implants.
                                                                                                                                                                                                                                                                                                                                                                                                            method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. Th present sequence represents human collagen 1 (alphal) helical region, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present amino acid sequence represents a human gelatin protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                               The present sequence represents a human type 1 (alpha1) collagen protein. Peptides derived from the protien were used to demonstrate incorporation of 3,4-dehydro-L-proline into the peptide, using the method of the invention. The specification describes a method for the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting at least one 3,4-dehydroproline residue in the polypeptide with an epoxyproline residue. The method is used for studying the effects of non-natural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bioadhesives), and for incorporating a wide variety of groups, including therapeutic ligands and biological probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; 3-hydroxyproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation;

The specification describes a method for producing an extracellular matrix protein is matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimisating a mucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hyperconic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-chydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The proteins edepends which do not normally contain trans-4-hydroxyproline. The present sequence represents a chimeric collagen 1 (alphal)/decorin protein, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

ö
and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                    Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; 3-hydroxyproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation; se. transforming growth factor-betal; TGF-betal; chimera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Production of extracellular matrix proteins containing 4-trans-
hydroxyproline results in native self aggregating proteins, useful on
medical implants.

```

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily by dydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell, and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-pydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. The present sequence represents chimeric collagen 1 (alphal)/transforming growth factor-betal (TGF-betal) protein, which may be produced using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                Gaps

 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.

The invention relates to a novel isolated polymuclectide comprising any of the 235 mucleotide sequences described in the specification. The invention further comprises: an isolated polymucleotide encoding a polypeptide with biological activity, where the polymucleotide hybridizes to one of the 235 movel polymucleotides under stringent hybridization conditions, or having greater than about 99% sequence identity with the novel polymucleotide; an expression vector comprising a novel polymucleotide; an expression vector comprising the novel polymucleotide; an operatively associated with a regulatory sequence that modulates cypression of the polymucleotide in the hose cell; an isolated colympeptide encoded by the novel polymucleotide, or a polymucleotide or hybridizing under stringent conditions to the novel polymucleotide; an composition comprising the polypeptide and a carrier; an antibody directed against the polypeptide and a carrier; an antibody directed against the polypeptide and a carrier; an antibody directed against the polypeptide; an exthod for identifying a compound that binds to the polypeptide; a method for identifying a compound that binds to the polypeptide; a method for identifying a compound that binds to the polypeptide; an end of the polymucleotides of the invention of polymucleotides and one of the polymucleotides cited above. The polypeptides and collection of polymucleotides and antimicrobial activities The novel polymucleotide and activities 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for treating inflammation, leukaemias, nervous system disorders, setions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determination of collagen fragments in body fluids can be achieved by immunoassay using antibodies directed against synthetic peptides derived from collagen which contain sites of potential crosslinking. The method is used to diagnose and monitor treatment of disorders of collagen metabolism (degredation of type I collagen may indicate osteoporosis, metabolism (degression, Paget's disease, hyperthyroidism or other conditions involving excessive bone resorption; degredation of type II collagen may indicate rheumatoid arthritis or osteoarthritis; and of type III collagen, woulties syndrome). The method can also be used to assess the toxicity of a compound and to test drugs for their effect on collagen metabolism. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence is that of human type I collagen alpha-1. The invention is based on the discovery of the presence of particular collagen fragments in body fluids of patients compared with those of healthy subjects. These fragments are generated upon collagen degradation and are partly characterised by the presence of potential sites for crosslinking. A method for assaying collagen fragments in a body fluid sample is based on the competitive binding to immunological binding partners of collagen fragments in the sample and of synthetic peptides derived from collagen and containing crosslinkable sites (see AAYS6105-11). When considering the degradation of type I collagen, the assay can be used as a means of identifying excessive bone resportion, indicating the presence of osteoporosis or the metastatic progress of a malignancy. Other conditions characterized by excessive bone resportion include

Collagen type I alpha-1.

19-DEC-2000

AAY96122;

```
The invention relates to a method for assaying type I collagen fragments (I) in body fluid. The method involves treating the test sample with: (i) synthetic peptide, immobilised on a support; and (ii) immunological binding partner, reactive with the synthetic peptide, so that (I) and the synthetic peptide compete for binding, and (I) are quantified by measuring the binding of the binding partner to the synthetic peptide. The method is used to diagnose disorders of collagen metabolism, especially osteoarthritis but also Pager's disease, Marfan syndrome, osteogenesis imperfacta, neoplastic growth of collagenous tissue, dwarfism, rheumatoid arthritis or vasculitis, also for clinical testing of drugs to assess their effect on collagen metabolism. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Assaying type I collagen fragments in body fluid, useful for diagnosis and assessing treatment of e.g. osteoarthritis, by competitive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a peptide synthesised to match an alphal(I) or alpha2(I) telopeptide component of a cross-linked telopeptide degradation product of type I collagen. The method is useful for assaying collagen calgagen types I. II and III and for diagnosing the degradation of human collagen types I. II and III and for diagnosing the presence of disorders associated with the metabolism of collagen, especially osteoporosis. The peptide is useful in methods to assess an abnormal condition of a subject for e.g. excessive bone resorption which shows the presence of an cateoporotic condition or the metastatic progress of a malignancy, paget sides as an benomment of a malignancy, paget sides as an benomitored by determining collagen degradation, examples are collagen type II degradation associated with rheumatoid arthritis, osteoparthritis, and collagen type III degradation in castolitis syndrome. Since the conditions of the subject can be monitored continuously, application of these assays can also be used to monitor the progress of theretapy administered to treat these or other conditions and as a measure of toxicity, since the administration of toxic substances often results in tissue degradation. The present sequence is human collagen alphal (I) protein used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel peptides that match alpha 1 or 2(I) telopeptide component of cross-linked telopeptide degradation product of type I collagen useful for diagnosing disorders associated with collagen metabolism e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Human collagen alphal(I) chain precursor

(first entry)

12-FEB-2004

ADF13075;

```
The present sequence represents human collagen type I alphal. The specification describes a method for assaying type II collagen fragments in a body fluid sample. The method comprises contacting the body fluid sample. The method comprises contacting the body fluid amino acid sequence that competes with the ollagen fragments for alphal amino acid sequence that competes with the collagen fragments for binding with the immunological binding partner. The method is useful for assaying collagen fragments in body fluids. The method is particularly useful in assays for measuring bone resorption rates in patients or in healthy subjects. The method may be used for determining abnormalities in collagen metabolism, especially in Paget's disease, Marfan's syndrome. The method may be used for determining the degradation of human collagen of type I. II and III. It also can be used during clinical testing of new drugs to assess the impact of these drugs on collagen metabolism. The assays, can be used as a measure of toxicity, since the administration of toxic substances often results in tissue degradation. Thus, the assays may be used as an index of the condition, treatment or effect of substances days an index of the condition, treatment or effect of substances directly administered to the subject or to which the subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     determining abnormalities in collagen metabolism, e.g. in Paget's disease or Marfan's syndrome, comprises contacting the fluid with a synthetic

The invention relates to a new method for determining collagen fragments in a body fluid which comprises contacting the sample with an immunological binding partner for the fragments, where the binding partner is immunoreactive with synthetic peptides whose sequences are essentially derived from collagen and contain potential sites for cross linking, and is incorporated as a whole antibody or its immunological fragment in an assay for quantitative determination of collagen fragments in the sample. The invention is useful for diagnosing disorders associated with the metabolism of collagen or whether a susceptible subject is suffering from collagen degradation. A test kit for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      quantitating the amount of collagen fragments in a body fluid is claimed. The present sequence represents the amino acid sequence of human collagen alphal(I) chain precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining collagen fragments in a body fluid sample using antibodies against synthetic peptides containing crosslinking sites is useful to diagnose collagen metabolism disorders or if a subject suffers from collagen degradation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```
The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid,
                                                                               Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; 3-hydroxyproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation;
                                                         Amino acid seguence of a chimeric collagen 1 (alphal)/decorin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Production of extracellular matrix proteins containing 4-trans-
hydroxyproline results in native self aggregating proteins, useful on

The invention provides a method for the production of fibrillar collagen. The method comprises: (a) culturing a recombinant host cell comprising a DNA encoding a fibrillar collagen monomer lacking a C propetide SSAD (sequence selection and alignment domain); and (b) producing the fibrillar collagen. The methods are used to produce fibrillar collagen, from which telopeptide collagen fibrils can be derived. Host cells, comprising DNA encoding a collagen monomer lacking SSAD or N propeptide is used to produce gelatin. Collagen is used in biological research as substrate for in vitro cell culture and as a component of biocompatible materials for use in prosthetic implants, sustained drug release materials artificial skin and wound dressing and healing devices. Gelatin is particularly useful for foodstuffs and medicine, for coating tablets and making capsules. The methods, comprising the use of collagen monomers
                                                                                                                                                                                                                                                                                                                       ö
selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. The present sequence represents a chimeric collagen 1 (alphal)/decorin protein, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fibrillar collagen; C propeptide; SSAD; telopeptide; gelatin; sequence selection and alignment domain; prosthetic implant; foodstuff; medicine; type I collagen; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New method for production of fibrillar collagen, useful for preparing telopeptide collagen fibrils and gelatin.

The present invention relates to recombinant synthesis of collagens and gelatins derived from animals. Collagen is useful in medical, pharmaceutical, food and cosmetic industries. Collagen is an important component of arterial sealants, bone grafts, drug delivery system, dermal implants, haemostats, and incontinence implants, and for treating autoimment disorders such as rheumatoid arthritis. Collagen is useful in food products such as sausage casings, and in cosmetics or facial and skin products such as sausage moisturisers. Recombinant gelatin is useful in food products such as useful in the manufacture or as a component of various pharmaceutical and edical devices and products, in food and beverage industries, in hair care and skin care products, as a glue or adhesive in various manufacturing processes, as a light-sensitive coating in various
                                                                                                                                                                                                                                                                                                                                                                                                                                Porcine; alphal(I) collagen; gelatin; cytostatic; viral infection; pharmaceutical; food industry; cosmetic; autoimmune disorder; vaccine; medical; arterial sealant; bone graft; dermal implant; haemostat; cancer; rheumatoid arthritis; beverage; photographic application.
lacking the N and/or C propeptides, result in a large increase in the production of type I collagen. The present sequence represents the human preproalpha 1 (I) collagen (GenBank Accn no: AF017178)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated and purified bovine or porcine collagens and gelatins useful in medical, pharmaceutical, food and cosmetic industries, as vaccine, and for treating autoimmune disorders, infections and cancer.

```
The invention discloses a method for stimulating or inhibiting cell
growth and/or division which comprises contacting or inserting into an
animal cell a polypeptide comprising one of the deer antler cartilage
cell (DACC) clones disclosed. More particularly, the method relates to
the see polypeptides stimulating mesenchymal cell growth and/or division
and to transfecting these cells and chondrocytes with vectors carrying
the genes of these polypeptides capable of stimulating chondrogenesis,
costeogenesis, growth, repair, regeneration and/or restoration of the
extracellular matrix. The chondrocytes selectively express genes required
costeogenesis, growth, repair, regeneration and/or restoration of the
extracellular matrix. The chondrocytes selectively express genes required
costeogenesis, for stimulating mesenchymal cell growth and/or division by
cypospide, for stimulating mesenchymal cell growth and/or division by
cyposping animal mesenchymal cells to conditioned media or its active
fraction, obtained from deer antler cartilage cells, for inhibiting cell
growth and/or division by inserting into an animal cell, a compound which
inhibits the translation of the polymucleotide encoding the DACC. The

method and the polypeptides are useful for stimulating mesenchymal cell growth and/or division or for stimulating chondrogenesis, cartilage, disc or connective tissue growth, repair, regeneration and/or restoration in an animal. The polymcleotides, polypeptides, agonists and antagonists may be used in treatment modalities, specifically in gene therapy. The polypeptides can be used as bait proteins in a two- or three-hybrid assay to identify other proteins, which bind to or interact with the polypeptide and are involved in modulating cell growth and/or division. The sequences presented in ABG93923-ABG93948 are the proteins encoded by the DACC CDNA clones

WPI; 2003-268312/26. GENBANK; CAB01633 New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the movel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in method sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the The invention discloses a composition comprising two or more isolated

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal

Claim 1; Page; 1017pp; English.

```
polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that complete its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                  ö

subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially cypressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polymetries the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polymetries is the activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (CMI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed segmented that it is patent did not form part of the printed segmented in electronic form directly from WIPO at

```

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Example 1; Page; 1017pp; English.

```
comprising the vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a true to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a compound chair in a naimal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating copin and a pharmaceutical composition comprising the one or more of pain and a pharmaceutical composition comprising the one or more copin and a pharmaceutical composition comprising the one or more copin and a pharmaceutical composition comprising the one or more copin and a pharmaceutical composition comprising the one or more copin and a pharmaceutical composition comprising the conformation contriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. spinal sequence presented is a rat protein (described in Table 3 and protein form part of the printed specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_esquences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

GENBANK, CAB01633

The invention discloses a composition comprising two or more isolated rat cor human polymucleotides or a polymucleotide which represents a fragment, cerivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the movel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a gent increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound which regulates the compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating contivity in an animal of one or more of the polymucleotides given in the specification, a method for identifying a compound useful in treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates (CT) and spared nerve injury (SNI)) in an animal (e.g. gene the sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Once the sequence data for this patent did not form part of the printed sequence presented is eq Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung. ```
The invention discloses a composition comprising two or more isolated rate or human polymuclectides or a polymuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence which is differentially regulated in an animal subjected to pain and a compround to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymuclectide sequence that increases or decreases the expression of the polymuclectide sequence that is differentially expression of a polymuclectide sequence which is differentially expression of a polymuclectide sequence which is differentially expression of a polymuclectide to pain, a method for identifying a compound that regulates the activity of sequence which is differentially a compound that regulates the activity of a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polymuclectides or their antibodies. The polymuclectide or the compound that complete is a setivity is useful for identifying a compound useful in treating conditates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (CNung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. spinal sequence presented is a rate protein (described in Table 3 of therapy). The sequence presented is a rate protein (described in Table 3 of the specification) which is differentially expressed during pain.

Con the specification which is differentially expressed during pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                              New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

or human polynucleotides or composition to the calculation to the inversion understood a composition of the nucleic acid sequence. Also derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a sequence that in differentially expression of the polynucleotide sequence that is differentially expression of the polynucleotide sequence which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the expression and an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound that regulates the activity of one or more of the polypeptides or their animal of one or more of the polypeptides or their antibodies. The polynucleotide or the compound that sectivity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates the activity is useful for preparing a medicament for treating pain in year sequence data for this patent did not form part of the printed or the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                 The invention discloses a composition comprising two or more isolated rat
                                                                                                                                                            New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

This invention describes a novel composition for improving transduction efficiency of a nucleic acid into a cell from nervous tissue which comprises a cell adheaion molecule and a gene-transfer reagent. The invention also describes a device, kit and novel method for improving nucleic acid transduction efficiency of a cell on a solid phase. The callaminin and fibronectin. The gene transfer reagent comprises a cationic polymer, cationic liquid, polyamine type reagent, polyamine type reagent or calcium phosphate. This sequence represents the murine FVB/N collagent pro-alpha-1 type I chain which is used in the composition of the
                                                                                                                                                                         Composition useful for improving transduction efficiency of nucleic acid
